1 General Information

1.1 System Overview

The Solo family of products is designed to adapt to a variety of controlled environments. It is exceptionally well suited for all types of farm buildings including poultry houses, pig houses, dairy barns, and greenhouses.

We recommend that you read this manual thoroughly before connecting and commissioning this product. Installation and use of this unit which does not comply with the operating instructions described in this manual is hazardous to the health and safety of people, may result in damages to the building and will void the warranty.

1.3 Symbols used

The following symbols will be used in this manual:

- **Caution, risk of ELECTRIC SHOCK**

- **Caution, risk of DANGER**

- **Important NOTE**
2 Usage & Features

The programmable lighting controller unit (LCL-0.2) is specifically developed to modulate the intensity of LED lighting products.

This controller is equipped with a graphical LCD display with white backlight and four navigation keys for programming lighting schedules. The controller provides two power outputs, configurable in automatic mode or in manual mode using dedicated bypass switches and an intensity knob.
The main characteristics of the controller include:

- Two 1000W precise light dimming output
- Output overload protection
- Minimum inertia method used for smooth sudden transitions in light intensity
- Minimum and maximum intensities specified as a percentage of full lamp intensity
- Internal clock with battery backup to keep time in case of failure
- Electronic bypass switches for each output
- Protection against leaving bypass switches in the ON position
- Capability to adjust light intensity according the voltage applied
- Up to 20 programmable periods base on the animals age with
  - Programmable sunrise and sunset lighting
  - Up to 12 light cycles per day
  - Up to 20 stimuli per day
- Two Analog 0-10V signal can be configured as outputs to drive remote controllers or as inputs to dim the light according to the signal level.
- Built-in USB port used for backup/restore configuration and firmware updates
3 Installation, Commissioning and Operation

3.1 Technical support

The technical support related to the Solo models can be obtained from your distributor or directly from the manufacturer.

Website: www.intelia.com

Email: support@intelia.com

Phone: 1-866-666-6221

3.2 Safety

The technical staff performing an operation on a controller must have read and understood this manual and accept its content.

Before the commissioning of the controller, all the connections must be checked. All the electrical cables and connections must be inspected to detect any potential defect.

The controller must not be operated if one of its components (whatever it is) is defective.

The repair or replacement of a defective component can only be done by the technical staff trained for this purpose. The qualification of this technical staff must be previously confirmed and accepted by your distributor.

The manual switches on a Solo controller are not a safe way to disconnect the equipment from the electrical network.

It is important to provide a complete disconnection device between the equipment and the controller, or to turn off the power at the source before undertaking any work on the equipment and its electrical wiring.

⚠️ The non-compliance with these instructions can cause the complete or partial voiding of the warranty.
When accessing the unit’s electronic board directly, there is a risk of ELECTRIC SHOCK if touching specific areas. To help the user know where these areas are located, a white line is printed right on the board to show the limits of the safe (1) and danger (2) areas. The danger area is also identified by a danger symbol (3) (refer to illustration below).

**Legend:**

1. Safe area
2. Danger area
3. Danger of electrocution symbol
3.3 Installation and Positioning

It is essential to respect the following installation instructions:

1. The controller is designed for a wall installation and it absolutely needs to be installed vertically.

2. The heat generated by the modulation circuit is released by the heat spreader located at the back of the device. It is therefore important to make sure that there is no obstacle that obstructs or disrupts the free flow of air 20 cm (8'') above and 10 cm (4'') below the controller.

3. It is important never to install the controller over a heat source such as a radiator or another controller equipped with a heat sink.

4. The controller must be installed in a location where it will not be exposed to noxious gases or excessive moisture. It shall in no case be sprayed directly.

5. The temperature of the location where the controller will be installed must always be between 0°C and 40°C (32°F and 104°F).

6. The relative humidity of the location where the controller is installed must always remain between 5% and 90%.

7. The low voltage cables (control signals, sensors and potentiometers) must be isolated from the high voltage cables.

8. It is absolutely mandatory to connect the ground wire at the location provided to this purpose. An improper grounding could lead to malfunction.

9. The wall where the controller is installed must be flat and able to withstand a temperature of 80°C (180°F). The controller must never be installed directly on a Styrofoam or urethane wall, or any other heat-sensitive material.

10. Install the controller in an accessible location at eye level for ease of installation, usage and maintenance.
3.4 Electrical Connection

3.4.1 Electrical Wiring and Connections

TURN OFF POWER AT THE SOURCE BEFORE AND DURING THE CONNECTION TO AVOID ANY RISK OF ELECTROCUTION AND DETERIORATION OF THE CONTROLLER.

The controller installation must comply with the wiring diagrams provided. These will give all the necessary information for an electrician to carry out all the wiring operations. In addition to all the electrical standards in effect, the following conditions must be respected:

1. All the perforations for the passage of the electrical cables must be made from underneath the unit. The non-compliance with this instruction can cause the complete or partial voiding of the warranty.

2. All the perforations made to route the electrical cables must be sealed with putty to prevent damage caused by moisture condensation inside the controller.

3. The wires must be identified at both ends with appropriately sized wire markers so they do not slip and come off.

4. The signal and communication cables must not run along an AC power cable for more than 60 cm (2 feet) to avoid electrical background noise affecting the signal.

5. The probe and communication cable must be of minimum size #22AWG in shielded, twisted and insulated copper with a PVC sheath.

6. A grounding conductor of stranded copper #12AWG must be provided and installed at the required location.

3.4.2 Wiring Diagram

For input/output connection details, please refer to the wiring diagrams shown in Appendix C.
3.5 Starting the System

Starting the system will differ depending on the Power Expansion mode used in the Advanced Parameters menu (see section 0)

3.5.1 When Using Power Expansion Master Mode

For system configuration in Master mode perform the following steps:

System Setup

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Enable outputs and calibrate lighting intensity according to the applied voltage. See Configuration &gt; Outputs menu section 6.1.</td>
</tr>
<tr>
<td>2</td>
<td>Set the date and time of the system to allow a consistent functioning of the lighting periods and consistent history backups. Then set your display preferences. See Configuration &gt; Local Settings menu - section 6.3 -</td>
</tr>
</tbody>
</table>

Daily Operation Setup

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Configure lighting curves to determine the lighting periods throughout the production cycle. See Operating Parameters menu (section 5)</td>
</tr>
</tbody>
</table>

Activate and Start

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>make sure to switch all outputs from MANUAL to AUTOMATIC mode See Output Control menu (section 5.4)</td>
</tr>
<tr>
<td>5</td>
<td>Finally, apply the lighting curve by setting the controller to Production Mode See Production menu (section 5.3)</td>
</tr>
</tbody>
</table>
3.5.2 When Using Power Expansion Slave Mode

When used as a slave, it is the network master unit that manages the controller. However, the configuration for the Slave mode must start while the unit is still in Master mode so the parameters needed for outputs are available.

For system configuration in Slave mode perform the following steps:

<table>
<thead>
<tr>
<th>System Setup</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
</tbody>
</table>
## 3.6 Battery Replacement

An error message is displayed whenever the battery level is too low. Please proceed to its immediate replacement to avoid time and configuration loss in case of power failure.

| ![Battery Icon] | Keep power ON during the following procedure to avoid irreversible configuration loss |
| ![Warning Icon] | Be careful not to touch circuit components other than the battery to avoid risks of electrocution. Refer to section 3.2 for more detailed information. When in doubt ask help from a specialized technician. |

Follow these steps to replace the battery:

1. Open the case
2. Locate the position of the battery (on the top left corner of the main board).  
   Take note of the polarity of the battery so the new one can be installed in the same position.
3. Pull up on the battery to remove it.
4. Place a new CR2032 lithium battery by sliding it between the socket and the contact making sure it is inserted in the same position as the one just removed.
5. Close the case.
Solo Lighting Control – LCL-0.2 model

4 User Interface

4.1 Control and display for model LCL-0.2

Status lights

<table>
<thead>
<tr>
<th>Communication</th>
<th>This status light flashes on and off whenever data flows on the communication bus.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Warning</th>
<th>Flashing: when the Manual control, Simulation or Calibration option is activated.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Fixed: when the control detects a preventive maintenance needs to be done, such as: change the battery, sensor fault ...</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Alarm</th>
<th>Flashing: at least one alarm is not acknowledged,</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Fixed: all active alarms are acknowledged</td>
</tr>
<tr>
<td></td>
<td>Off: no alarm is active.</td>
</tr>
</tbody>
</table>

Manual control

<table>
<thead>
<tr>
<th>Manual control switches offer three possible positions:</th>
<th>AUTO: The output is automatically controlled according to the current defined parameters.</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF: The output is manually disabled.</td>
<td></td>
</tr>
<tr>
<td>ON: The output intensity is set by the Adjustment Knob.</td>
<td></td>
</tr>
</tbody>
</table>

| Adjustment Knob: This button allows adjusting light intensity when one or more control switches are set into the ON position. Note: The manual intensity adjustment knob adjusts both lighting outputs simultaneously if both are set on manual mode (Control Switches in the ON position). |
Navigation keys

Navigation through the system’s different menus and modification of parameters configurations are performed using the following four buttons:

- **Menu-Back**
  - To return to previous menu or cancel the current modification.

- **Up**
  - To increment a value or scroll up through a selection list.

- **Down**
  - To decrement a value or scroll down through a selection list.

- **OK**
  - Selection and validation of changes made

Navigate through menus and available options

1. From the home page, press **Menu-Back** to access the main menu.

2. Use **Up** and **Down** to select the desired sub-menu and press **OK** to access available options

Modify a parameter

1. Activate Edit mode of a selected parameter by pressing **OK**.

2. Modify the value using **Up** and **Down**.

3. Press **OK** to confirm the change or **Menu-Back** to cancel.
4.2 Controller Menu and options

Navigation through menus and sub-menus depends on which options are activated in the configuration menu. Thus, if one or more of the parameters presented below is not displayed on your unit, it is because they are not used by the functions that you chose to activate.

The menus available are also dependent on the mode option chosen for the **Power Expansion Mode** in the **Advanced Parameters** menu.

<table>
<thead>
<tr>
<th>Menu for the <strong>Master</strong> option</th>
<th>Menu for the <strong>Slave</strong> option</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
5 Operating Parameters

This section describes each menu available when using the Master mode of the Power expansion parameter.

Press the Menu-Back key to access the main menu:

5.1 Home

The Home menu is the default display of the controller and it provides a quick snapshot of controller information. It is always possible to access Home pages by pressing the Menu-Back key as many times as necessary to display the home page. The home page is displayed as follows:

If the system is in Manual Control or in temporary manual override mode, the home page alternates with one of the two following warning pages:

<table>
<thead>
<tr>
<th>Home</th>
<th>(D6)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual Control</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Home</th>
<th>(D6)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temporary Override</td>
<td></td>
</tr>
<tr>
<td>Time Left : 20:10</td>
<td></td>
</tr>
</tbody>
</table>
5.2 Lighting

The lighting submenus are used to view the lighting status, configure the lighting program according to the age of the animals and configure the temporary lighting override.

The light controller can manage each output independently or share a single schedule (curve) over the production. To manage both outputs on separate curves, the option Independent must be selected in Advanced Parameters (see section 0 ). According to this option, the lighting menu will then display as shown.

<table>
<thead>
<tr>
<th>Lighting</th>
<th>Lighting</th>
</tr>
</thead>
<tbody>
<tr>
<td>▶ Summary</td>
<td>▶ Summary</td>
</tr>
<tr>
<td>Curve</td>
<td>Curve</td>
</tr>
<tr>
<td>Temporary override</td>
<td>Temporary override</td>
</tr>
</tbody>
</table>

5.2.1 Lighting Summary

The Lighting Summary page displays the general lighting status as shown below:

<table>
<thead>
<tr>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setpoint (prod.) 10%</td>
</tr>
<tr>
<td>#</td>
</tr>
<tr>
<td>A</td>
</tr>
<tr>
<td>B</td>
</tr>
</tbody>
</table>

Display for shared curves

<table>
<thead>
<tr>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setpoint (prod.)</td>
</tr>
<tr>
<td>#</td>
</tr>
<tr>
<td>A</td>
</tr>
<tr>
<td>B</td>
</tr>
</tbody>
</table>

Display for independent curves
Current lighting setpoint and its source:
The setpoint defines the light intensity targeted in percent. The source of its definition depends on the operating mode.

- **non-production**: the setpoint comes from the Production page – see section 5.3.1.2.
- **production**: the setpoint comes from the Lighting - Curves page – see section 5.2.2.
- **manual**: the setpoint comes from the Lighting - Temporary Override page (see Temporary Override for details – section 5.2.3) or the Output Control page (see Output Control for details – section 5.4).

Current status and intensity lighting outputs:
The status defines which source currently sets the intensity of the output. These sources are:

- **AUTO**: the lighting output takes the setpoint defined above.
- **Manual**: the lighting output is under manual control (see Output Control for details - section 5.4).
- **Dimmer**: the lighting output takes the setpoint of its external dimmer currently set to manual (0 to 100%). Set the dimmer to Auto so that the lighting output takes the setpoint of the solo system.
- **Switch**: The output is set on manual operating mode. The intensity is set by the Manual Intensity Adjustment Knob.
5.2.2 Curve

The Curve page allows the definition of the light schedule and its transitions according to the age of the animals.

All lighting outputs operate along a curve constituted of up to 20 lighting periods. Each period may include up to 12 cycles and 20 stimuli per 24 hours.

The page to the right presents a lighting curve summary.

- To edit or view details, select a period.
- To create a new period, select "---".

Up to 12 lighting cycles and 20 stimuli per day can be defined for each period. Each lighting cycle is performed as shown in Figure 1. Transitions at the beginning and end of the cycle simulate the natural sunrise and sunset to reduce animal stress. Growth and weight gain are enhanced by the introduction of momentary light stimuli during a light cycle. The intensity of the stimuli is variable.

<table>
<thead>
<tr>
<th>Period</th>
<th>Daylight</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-4</td>
<td>95&gt;60%</td>

</tr>
<tr>
<td>21-50</td>
<td>60&gt;45%</td>
<td>10:50</td>
</tr>
</tbody>
</table>

Figure 1  Lighting cycle - Variation of intensity versus time
5.2.2.1 Period Settings

Each period includes the same parameters that define the daily light schedule according to the animals age.

These parameters are explained in detail thereafter:

**Day Start**: (0 to 500)

Determines the start day for the period. All parameters for this period will be applied until the production day reaches the start day of another period. If the period is the last defined, the parameters will be repeated indefinitely until the production day is reset by the user.

**Day Intensity**: (0 to 100%)

The day intensity is the light intensity when the lights are turned on. This intensity can be constant every day or slowly transiting to the value of the day intensity defined in the next period.

- **Constant Daylight Mode**: lighting intensity within the lighting cycles once the transition is complete.

- **Gradual Daylight Mode**: lighting intensity used to calculate the current daylight intensity value. Daylight intensity is applicable within the lighting cycles once the transition is complete.

**Night Intensity**: (0 to 100%)

Lighting intensity outside of lighting cycles.

**Daylight Mode**:

- **Constant**: The Daylight intensity remains steady over the period.

- **Gradual**: The Daylight intensity is automatically adjusted during the period. A linear regression is applied as shown in Figure 2 Variation of daylight intensity over the periods.
Figure 2  Variation of daylight intensity over the periods

5.2.2.2  Daily Cycles Settings

The daily cycle allows turning the lights on and off several times per day according to the animals age, the type of production, the feed schedule, ...

**Transition On**: (0 to 100 min)

This parameter simulates the gradual increase of light intensity during a sunrise. It corresponds to the time that will be used to increase the level of intensity from **Night Intensity** to **Day Intensity** before each cycle.

**Transition Off**: (0 to 100 min)

This parameter simulates the gradual decrease of light intensity during a sunset. It corresponds to the time that will be used to decrease the level of intensity from **Day Intensity** to **Night Intensity** at the end of each cycle.
Solo Lighting Control – LCL-0.2 model

**Cycles:**

The cycles define the time of the day when the light turn on and off. There are up to 12 cycles possible per period.

Select the option **Edit** to bring up the page to the right and determine the following parameters for each cycle.

**Enable**: Select this option to activate the cycle.

**Start**: Starting time for lighting cycle (00:00 to 23:59).

**Stop**: End time for lighting cycle (00:00 to 23:59).

<table>
<thead>
<tr>
<th>Cycles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>...</td>
</tr>
<tr>
<td>12</td>
</tr>
</tbody>
</table>

**5.2.2.3 Daily Stimuli Settings**

The Daily Stimuli is entirely independent of the day intensity and the day cycles. That option allows to define a second intensity step in place at any moment of the day. It’s especially useful to stimulate animals to eat or drink by increasing the light for a short moment during a light cycle.

**Intensity**: (0 to 100%)

Lighting intensity of the Stimulus

**Transition On**: (0 to 100 min)

The time that will be used to increase the level of intensity from **Day Intensity** to stimulus **Intensity**.

**Transition Off**: (0 to 100 min)

The time that will be used to decrease the level of intensity from stimulus **Intensity** to **Day Intensity**.
**Stimuli**: Select the option *Stimuli - Edit* to bring up the Stimuli page shown to the right.

For each stimulus, set the following parameters:

**Enable**: Select this option to enable the stimulus.

**Start**: Starting time for stimulus (00:00 to 23:59). A stimulus will be performed only within a lighting cycle.

**Duration**: Duration of the light stimulus (from 00m00s to 23m59s).

### 5.2.3 Temporary Override

The Temporary Override page allows overriding the lighting intensity setpoint temporarily without changing the current lighting curve. This prevents accidentally leaving the lights on when maintenance is finished.

To temporary override the current lighting setpoint, follow these steps:

1. Select the **Activation Duration** of the setpoint (1 to 120 min) and the desired **Manual Intensity** of lighting (0 to 100%).

2. Start the temporary override by checking the **Temporary Override** checkbox.

The temporary override setpoint will be applied during the activation duration; once this time has elapsed, the temporary lighting control is automatically disabled.
The temporary manual override mode can be enabled/disabled in any program mode by simultaneously pressing on the up and down arrows on the controller.
5.3 Production

The solo ensures the monitoring and management of production settings, as well as that of non-production times used for cleanup. This menu allows starting or stopping production as well as changing the production day.

5.3.1 Starting and managing a production

5.3.1.1 In Production

To start production, follow these steps:

1. Enable the **In Production** option; the Production page appears as shown to the right.

   ![Production](image)

   **Production**

   | In Production | ✓ |
   | Day           | 10 |

   Update the Production day (between 0 and 500). The production day corresponds to the animals age. This day is used to determine which lighting periods is applicable (refer to Lighting > Curve for details – section 0).

5.3.1.2 Non-Production

To operate in Non-Production mode, disable the **In Production** option; the Production page appears as shown to the right:

![Production](image)

**Production**

| In Production |  ❌  |
| Lighting      | 10 % |

Adjust the desired lighting intensity (0 to 100%) in the Non-Production mode. Lighting outputs will be automatically adjusted to this value.

5.4 Output control

The menu **Output Control** allows the user to manually control all active outputs of the solo controller without using the bypass switches.

This option is especially useful to test the output or during building maintenance.

![Output Control](image)

**Output Control**

<table>
<thead>
<tr>

<td>Manual</td>
<td>50%</td>
</tr>
<tr>
<td>B</td>
<td>Manual</td>
<td>50%</td>
</tr>
<tr>
<td></td>
<td>All Automatic</td>
<td></td>
</tr>
</tbody>
</table>
Solo Lighting Control – LCL-0.2 model

The options are:

**Output #:**

Controller output identifier. Only the active outputs are listed.

**Status:** Controller mode status

- **Auto:** the output will be enabled or disabled according to the lighting curves.
- **Manual:** output is manually enabled according to the manual value.

**Value:** Current lighting intensity.

To change the control mode of any output, select the desired output and follow these simple instructions.

One of the following pages will appear depending on the current mode selection for this output:

Select the desired mode (**Auto / Manual / OFF**).

When the **Manual** mode is selected, a value should be selected for the lighting intensity. The output is automatically adjusted to the value entered.

When the **OFF** mode is selected, the lighting intensity correspond to 0%.

- **Warning:** If one or more outputs are not in AUTO control mode, the warning LED light flashes and a message appears on the Home page.

- **Warning:** If the All Automatic hot key is selected, the Temporary Manual Override option is automatically disabled (see Temporary Override – section 5.2.3).
To rapidly set all available outputs to automatic mode, select the **All Automatic** hot key located at the bottom of the page.
6 System Configuration

The Configuration Menu is used to setup the initial parameters during the installation.

The configuration menu allows to configure the light curves according to the lamp model, the operation mode, the user preference, password, options to backup or restore settings and finally update the firmware.

6.1 Outputs

This menu allows activating and calibrating the power outputs of the solo lighting controller.

Select the output you wish to setup and define the lighting output settings as follows:

1. **Enable the Output**

   Check **Enable** to enable the output.

2. **Calibrate the lighting output.**

   The light intensity is not the same for all lamp models. There are differences from one model to another. Rather than using sophisticated light sensor we provide the means to calibrate an intensity curve that is made from 5 calibration points plus the ignition point, providing a much better lighting every day. This adjustment procedure is normally required only once during the controller installation.
Solo Lighting Control - LCL-0.2 model

a) Select **Calibration Edit** to enter in calibration mode.

The page to the right appears:

b) Adjust the **ON Threshold** setpoint:

   **On Threshold** is the minimum voltage that the lamp needs to turn on at the lowest intensity. So, when the system turns on the lamps, the ignition voltage defined by the **On Threshold** value is momentarily applied, then the intensity is adjusted to the current setpoint.

   Set the **ON Threshold** value to adjust the minimum power that the controller must inject for light activation.

   - A value too high will result in an intensity peak upon light activation.
   - A value too low will prevent the lights from turning on at low intensity levels.

c) Adjust the Minimum Intensity (1%):

   Intensity 1% is the lowest light intensity desired. At lower value, the lights turn off. To set the lowest intensity, just change the value of Intensity 1% until the brightness of all the lamps lit equally at the lowest desired intensity. The light intensity will change instantly while the value is changed.

d) Adjust the next point of the curve

   Select Intensity 25% and change the brightness until the intensity of the lamp is around 25 %. The output delivers intensity proportional to the input value.

e) Repeat step c for all remaining intensity levels (**Intensity 50%**, **Intensity 75%** and **Intensity 100%**). At any time, the output can be turn off by selecting **Stop**.
Solo Lighting Control – LCL-0.2 model

3. If there are some percentage values where there is disparity between lamps, it is possible to exclude these values by entering these percentages in the **Excluded Percentages** section. Select one of the percentage entry points and edit it to the desired value. A maximum of 5 points can be entered. In normal operation, the controller will jump over these points.
6.2 Advanced Parameters

The Advanced Parameters menu allows the user to configure advanced settings for additional and advanced operating parameters.

As the controller starts, parameters are initialized to default values (shown below), thereby allowing the standard utilization of the solo system. The user can decide whether to customize these values to meet the specific needs of the production environment.

**Master Mode**

<table>

Solo Lighting Control – LCL-0.2 model

Power Expansion

**Mode**: the LCL model can be configured as Master dimmer used to manage the light schedules for its own outputs and extra controller outputs through a 0-10V signal. When configured as a Slave, the controller simply dims the LED lamps according to the level of the 0-10V signal it receives.

- **Master**: the controller applies the lighting program (depending on the period and lighting cycle defined for the production day and system time). The master controller also applies a low intensity signal (between 0 and 10 volts) to the power expansion bus, which is proportional to the current intensity required by the lighting setpoint. This signal is interpreted by all slave controllers to modulate their outputs connected to an intensity requested by the master controller.

- **Slave**: the controller follows the low intensity signal provided by the Master controller. In this mode, only the configuration menu will be available and the *Home* page will be displayed as shown to the right.

![Home page](D6)

- A. 10%
- B. 10%
Solo Lighting Control - LCL-0.2 model

Lighting Control

**Curve:**
- **Shared:** Both outputs follow the same lighting schedule.
- **Independent:** Each output follows its own lighting schedule.

**Control Mode:**

Its purpose is to provide different light control waveforms. According to the type of lamp, some modes offer best stability and linearity. The options available are:
- **Leading Edge:**
- **Trailing Edge:**
- **Central Band:**
- **Offset:** Percentage of offset from 5% to 100% in steps of 5. The default value is **Offset 35%**.

- [Image of Leading Edge curve]
- [Image of Trailing Edge curve]
- [Image of Central Band curve]
- [Image of Offset 50% curve]
6.3 Local Settings

This menu allows the user to enter the following local settings:

**Language:**
Language used (English / Français) in the control interface.

**Date / Time:**
Current date and time.

**Format-Date:**
Date display format. Three date formats are available:
- YYYY-MM-DD,
- DD-MM-YYYY, or
- MM-DD-YYYY

**Format-Time:**
Time display format. Two time formats are available:
- 24h or
- AM/PM.

Incorrect date and time settings may result in inconsistent history backups.

6.4 Password

This menu is used to limit controller access to authorized personnel only.

Enable: Check this option to limit the access to the solo controller by using a password. The user must confirm his password before having access:

When the password is activated:

- If no session is active, then only the Home menu is accessible.
- The user must log on to access the menus, parameters and system configuration.
- A return to the Home menu will automatically ends the session.
- A session is automatically ended after an period of inactivity (refer to Logout Delay parameter for details).

Lock Toggles: When this option is activated, the toggle switched on the front of the unit are locked in automatic mode regardless of the switch position.

Password: The password is the access code required to access the main menu from the home page.

Logout Delay: Period (from 1 to 60 min) after which an idle controller will automatically return to the Home display. If a session is open, it will automatically logout after this time delay.

For calibration pages linked to outputs, a 5-minute logout delay is applied in all cases.

6.5 Backup and Update

This menu provides information about the current version of the solo controller and allows importing or exporting configurations, as well as updating the software as needed via the USB port located on the unit’s main board.

**Current Version**: Current software version

**Model**: Current model and programming.

**Serial number**: Serial number of the solo controller.

**Configuration Import Procedure**

This option allows the user to import an existing configuration file (either from another solo controller of the same model or a previous controller backup).

**Prerequisites**:

- A USB key containing one or more configuration files must be available.

  This configuration file may be obtained from a previous Export procedure from the same Solo equipment or from another Solo.

  To prevent any data loss, it is highly recommended to export the current configuration before importing a new one.

**Procedure**:

1. Select the **Configuration Import** function.
2. Insert the USB key containing the configuration file into the USB port.
3. Launch the import process.

  **Result**: The Solo interface will display a list of all the configuration files located on the USB key.
4. Select the desired configuration file.
   
   – If you want to import the configuration, press **OK**.

   *Result:* this launches the import sequence where the current configuration is deleted and replaced by the new one.

   *Note:* *Do not remove the USB key during the import process.*

   – If you want to cancel the import, press the **Menu** key to return to the previous menu.
Configuration Export Procedure

This option allows the user to export the current configuration of the Solo controller to a USB drive.

Prerequisites:

- A USB key with sufficient space for the configuration file must be available.

Procedure:

1. Select the Configuration Export function.
2. Insert the USB key into the USB port.
3. Launch the export process.

Result: The solo controller automatically creates a file on the USB key and displays the following menu.

<table>
<thead>
<tr>
<th>Configuration - Export</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export to</td>
</tr>
<tr>
<td>LCL-0.2_04.cfg</td>
</tr>
<tr>
<td>Confirm</td>
</tr>
<tr>
<td>Cancel</td>
</tr>
</tbody>
</table>

Note: the name of the file created includes the Solo model from which it is exported with two more sequential digits to differentiate it from other files created previously.

4. Select either Confirm or Cancel.
   - If you select Confirm and press OK the export sequence is launched. The current configuration will be saved on the USB key in the file named on the interface.
     
     Note: Do not remove the USB key during the export process.
   
   - If you select Cancel and press OK, The export is aborted and the display returns to the previous menu.
Firmware Update Procedure

This option is used to update the Firmware (embedded software) using a USB key. It is possible to update all Solo controllers in a given network from a master controller.

Warning: risk of electrocution. Caution while plugging the USB key on the main circuit. Refer to section 3.2 for more detailed information.

Prerequisites:

- A USB key with the appropriate update files must be available.

It is highly recommended to export the current configuration before updating the firmware.

Procedure:

1. Select the **Firmware Update** function.
2. Insert the USB key into the USB port.
3. Press **OK** to launch the update function.

   Result: The solo controller displays the following menu where a request to confirm or cancel appears.

   ![Update Confirmation](image)

4. Select **Confirm** and launch the update, or select **Cancel** to cancel.

   *Note: Do not remove the USB key during the update process.*
7 Hardware Configuration

Several configurations may be done through the hardware located on the electronic board. This section describes each of them.

7.1 USB Interface

The system includes a USB interface which enables software updates and the calibration of lighting outputs. The USB interface is located close to the power circuits which deliver the power to the lamps. When using the USB key, it is imperative to avoid any contact with the power circuits to avoid severe and lethal injuries. The use of a USB key is reserved to electricians or technicians qualified by Intelia.

7.1.1 Firmware update

Warning: risk of electrocution.
Refer to section 3.2 for more detailed information.

1. Copy the software update at the root folder of a formatted fat 32 USB key;
2. Insert the USB key into the USB interface;
3. Press and hold the ENTER button for 5 seconds;
4. Take out the USB key.

Note: The approximative time for the file transfer to be completed is about 10 to 30 seconds. During the file transfer, the green LED close to the USB connector will blink quickly. The transfer is completed when the green LED pauses for 2 seconds and then turns off permanently.
7.1.2 Import and Export of calibration

Using the USB key, the controller can import and export the control mode and the outputs calibration from a file. This option is useful when you want to reuse your favorite calibration to other controllers.

The following procedure import the configuration from the file *curves.ini* and create a copy of the current configuration in the file *curves.bak*.

The user can easily edit those files with any standard text editor like Notepad to change the configuration. The file *curves.bak* can also be rename to *curve.ini* for importation in other controllers.

**Warning: risk of electrocution.**
Refer to section 3.2 for more detailed information.

1. Insert the USB key into the USB interface;
2. Press the ENTER button momentarily.
3. Remove the USB key.

*Note: The approximative time for the file transfer to be completed is about 1 to 5 seconds. During the file transfer, the green LED close to the USB connector will blink quickly. The file transfer is completed when the green LED pauses for 2 seconds and then turns off permanently.*
7.1.3 Removing a point of lighting intensity

This procedure allows the removal of a 1% intensity point on the lighting curve where lamps may be unstable or have different levels of intensity. When an intensity point is removed, the system creates an intensity jump avoiding the problem area. For instance, while executing this procedure, when the intensity is adjusted at 13%, the increasing intensity will jump from 12% to 14% and inversely from 14% to 12% when the intensity decreases.

It is possible to remove a maximum of 5 intensity point of 1%.

**Warning: risk of electrocution.**
Refer to section 3.2 for more detailed information.

When activating a programming mode, the unit will exit this mode automatically if no change is done within 60 seconds. To exit a mode, press ENTER momentarily.

1. Press quickly and consecutively on the ENTER button twice to enter the intensity point removal mode of a lighting curve. The status LED confirms the activation of this mode by continuously flashing as follows: 2 fast pulses followed by a pause.
2. Set the Bypass switches to Manual and adjust the lighting intensity to the value you wish to remove.
3. Press the ENTER button for 1 second.
   *Note: If one of the outputs is in automatic or OFF mode, this will not affect it.*
4. Repeat for all the points to be removed from the curve (a maximum of 5 points per curve)

To remove all exclusion points, make sure to be in the programming mode. Then hold the ENTER button for 5 seconds.
7.1.4 Light curve adjustment

Light intensity differs from one lamp model to another. Thus, a light calibration must be performed for the lowest acceptable brightness desired.

<table>
<thead>
<tr>
<th>Warning: risk of electrocution.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refer to section 3.2 for more detailed information.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>This procedure is not required if the calibration has been done from the user interface (Configuration &gt; Output &gt; Calibration).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Performing this calibration will change current output calibration.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>When activating a programming mode, the unit will exit this mode automatically if no change is done within 60 seconds. To exit a mode, press ENTER momentarily.</th>
</tr>
</thead>
</table>

1. Press quickly and consecutively the ENTER button 3 times to enter the lighting curve adjustment mode. The status LED confirms the activation of this mode by continuously flashing as follows: 3 fast pulses followed by a pause.

2. Set the bypass switches on the front of the unit to Manual and adjust the intensity of the lighting to the minimum intensity.

3. Press the ENTER button for 1 second.

   To reset the lighting curve to the factory default configuration, make sure to be in the programming mode press the ENTER button for 5 seconds.
7.2 Adjusting timespan in manual mode

The system incorporates a timer which forces the lighting control to go back into automatic mode following a prolonged use of the controller in manual mode. The allowed manual mode delay begins when the lighting output switch is changed from the automatic position to the manual position.

7.2.1 Adjusting timespan

Warning: risk of electrocution. Refer to section 3.2 for more detailed information.

Use a small screwdriver to adjust the timespan (1 to 120 minutes) by turning the potentiometer to the desired time delay.

It is important that no contact is made with any surrounding parts, which could lead to severe injuries or permanent damages to the system.

To disable the timer, align the potentiometer arrow with the infinite symbol $\infty$.

To revert to the manual mode after the timer expiration, change the controller switches position to automatic and then back to manual. This will start a new timer cycle.
# Appendix A. Technical Specifications

## Power supply
| Operating voltage and frequency | 85-145VAC, 50/60Hz (LCL-0.2-120V) | 200-260VAC, 50/60Hz (LCL-0.2-240V) |

## Inputs
| Analog input (AI1 & AI2) in Slave Mode | 0 - 10 VDC, input resistance: 43kΩ |

## Outputs
| Power Variable Output (A & B) | 1000 W per output |
| Analog Outputs (AI1 & AI2) in Master Mode | 0-10VDC, source, maximum load: 10mA |

## Communication (option)
| Protocol | Modbus |
| Interface | RS-485 |

## Mechanical
| Dimensions | 8.7" X 10.6" X 5.5" |
| Operating temperature | 32° to 104°F (0° to 40° C) |
| Storage temperature | 5° à 122°F (-15° to 50° C) |
| Relative humidity | 5 to 90% without condensation |
### Appendix B. Troubleshooting

#### 1 - The control outputs don't seem to respect the instructions given

1. Make sure that the control switches of the relevant outputs (located on the front panel of the solo controller) are in the AUTO position.

2. Ensure that the relevant outputs are configured in AUTO control mode (see section 5.4 Output control).

3. If a dimmer is associated to the output, ensure that this dimmer is fully turned to the left (AUTO position).

#### 2 - An error message appears during an import

1. Check that the USB key is properly inserted and that a configuration file compatible with your solo control (same model) is present.

#### 3 - An error message appears during an export

1. Check that the USB key is properly inserted and that your USB drive has sufficient memory space.

#### 4 - A "Low Battery" message appears on the home page.

1. Change the battery immediately to avoid data loss in case of power failure (see section 3.6 Battery Replacement for details).
### 5 - LED lights flicker, flash, pop or behave erratically.

1. Try another *Control Mode* in *Configuration > Advanced Parameters* - section 6.2

2. Investigate mains power for noise, voltage spikes, or distortion caused by neighboring equipment or dirty power.

3. Consider installing a power conditioner/filter.
Appendix C. Connection Diagrams

This appendix contains all the connection diagrams needed. A list is provided below giving a brief description and a figure reference for each diagram.

<table>

</tbody>
</table>
The electrical load distribution must be determined by a qualified electrician and installed as prescribed by the applicable regulations of the electrical code.

**Figure 3  Solo LCL-0.2 - Main Board - Page 1 of 4**
The electrical load distribution must be determined by a qualified electrician and installed as prescribed by the applicable regulations of the electrical code.

**NOTES**

(1) Refer to page 3 for electrical panel details for the 120V or 240V models.
(2) Refer to page 4 for power extension connection details.
(3) LB and NB must always be powered to allow the unit to operate.

*Figure 4  Solo LCL-0.2 - System Connections - Page 2 of 4*
Figure 5  Electrical Panel details for models LCL-0.2-120V and LCL-0.2-240V - Page 3 of 4

NOTES

- LB and NB must always be powered to allow the unit to operate.
NOTE
(1) A maximum of 10 units can be wired on the same network (1 Master and 9 Slaves max).
(2) The LEL-0.2 model is a companion slave unit. It comes without an operator interface and is intended to control additional power outputs commanded from a 0-10V signal. It offers the same performance features as the master units with two independent intensity adjustment knobs in manual mode.

Appendix D.  Intelia Warranty Declaration

1. INTELIA guarantees the customer that prior to shipment, each unit is free from defects in materials or labor for a period of twenty-four (24) months from the date of shipment. In no event, INTELIA cannot be held liable under this warranty, for any type of incidental, contingent, special or consequential damages, including, without limitation, lost profits.

2. The INTELIA warranty of Section 2 applies only to defects in parts, including, without limitation, the software and hardware manufactured by INTELIA or incorporated by INTELIA in the units, and to assembly defects related to a normal use. It does not cover the handling, the use, or the improper or careless storage of its products, nor any other handling, storage or improper use non-compliant with the instructions provided by INTELIA. It does not cover the items which the original label or serial number has been removed or altered. The warranty is automatically void if a backup controller and/or an alarm system is not installed on all control systems of the end customer in order to prevent losses caused by a controller failure. Without limiting the foregoing, the warranty does not cover improper usages or the damage caused, for example, by a bad connection relay to the circuit by the user;

   I. Incurred during shipping, storage or handling;
   II. Caused by inadequate maintenance;
   III. Caused by the failure to provide a suitable installation environment to the products;
   IV. Caused by a fortuitous event;
   V. Caused by the use of the products for purposes other than those for which they were designed;
   VI. Caused by a repair, adjustment, alteration or change made by a person not authorized by INTELIA.

3. INTELIA only performs the obligations set forth herein, excluding any other warranty or obligation. This warranty provides that in all cases, INTELIA is only responsible for the supply of parts or replacement products, and cannot be held responsible for any injury, damage, loss of profits, interruption of operations, fine for violations of the law or damage to the client's production, and the client must take up the defense of INTELIA and hold INTELIA responsible regarding any judicial or extra judicial proceeding, notice or request by the customer or a third party, regarding any judicial or extra judicial expense or cost resulting from such damage.
